

Google Video Vids Generative AI ~ Active Inference & Free Energy Principle

Active Inference & Free Energy Principle EXPLAINED | 3:00

all right today's July 15th 2024 and I got access to the Google Docs video system so thought it'd be fun to share where one prompt got me with no further editing the prompt I provided to the generator was informative accessible educational material for active inference in the free energy principle starts with a question of multi-agent coordination in the spatio temporal setting then Works gradually towards the variation free energy as proximate tractable objective SL imperative so I'm going to hit play on the site here and then I'm going to read from the script on the right okay here we go in this video we will explore active inference and the free energy principle a powerful framework for understanding multi-agent coordination in spatial temporal settings active inference in the free energy principle proposed that organisms and agents continuously minimize a quantity called free energy to predict future States and adapt their Behavior accordingly in multi-agent coordination each agent has its own internal model of the world and its own set of actions the goal is for each agent to coordinate its actions with others to achieve a common goal active inference and the free energy principle provide a framework for understanding how agents can coordinate

their actions in a spatio temporal
setting variational free energy is a
tractable objective function motion that
can be used to approximate the true free
energy of a
system minimizing free energy is a means
to predict future States and adapt
Behavior accordingly by minimizing free
energy agents can predict future States
and adapt their behavior to achieve
their goals active inference in the free
energy principle have applications in a
wide range of fields including robotics
neuroscience and artificial
intelligence in
robotics active inference can be used to
develop robots that can learn to
coordinate their actions with each other
and with

[Music]

humans in Neuroscience active inference
can be used to understand how the brain
processes
information
and makes

decisions an artificial intelligence
active inference can be used to develop
AI systems that can learn to adapt to
their enviro and achieve their goals
active inference and the free energy
principle offer a powerful framework for
understanding multi-agent coordination
in a spatial temporal setting
variational free energy provides a
tractable objective for active inference
principle have applications in a wide
range of fields including robotics
intelligence all right cool video thanks

Google looking forward to see where all
this goes thanks for watching bye
