

Introduction to recording & livestreaming with OBS

14:22

the approach of this video is to provide the minimum information needed to start experimenting with recording and live streaming with OBS and then go a little bit further from there this is a screen capture of OBS 30.0 being recorded with OBS 29.1 from a second monitor download this free open source software OBS from [OBS pro.com](https://obsproject.com) there are going to be three sections to this video the first is the recording live streaming equation which is going to introduce the fundamental equation the second section is going to be step by- step getting ready to go live in OBS recording or live streaming and then the third section is going to be live streaming lessons and checklists so first the recording live streaming equation video equals Audio Plus visual visual in OBS is what you see is what you get what is inside of the black rectangle will be included in the recording or in the live stream what is not in the Black Box will not be included that's the visual Rule and the audio rule is capture and balance the correct audio sources which we'll look at in the second section so let's go to the second section getting ready to go live in OBS so a few things about the interface of OBS first it's very flexible and customizable and there's different themes we'll look in the end at the settings about adjusting themes but your version of OBS may or may not

have the same theme and may or may not have the same starting layout as mine here however different sections are able to be moved and dragged around so it's very flexible and you can find out what works for you one of the most important things are the scenes and the sources so the scenes are like the different zones or moods that you want to be in and I put scenes and sources in the same window because once I'm in a given scene I'm only interested in looking at the sources and the sources are broadly audio and visual contributions to the video so the approach that we're going to take in this step by step is start with a fully working setup and then do a few actions that are important and see how to reconstruct those actions also from a blank slate but here in the context of a working setup and on the controls side we'll look at the settings last as well and the studio mode penultimate streaming and recording do what you think recording saves it locally only streaming sends it remotely only and you can hit both buttons at the same time so first let's balance the audio in the audio mixer section there are two audios here condenser microphone and desktop audio so I'm speaking locally on a physical condenser microphone phone so it is spiking and then here I'm going to bring in another audio Source that's going to play locally so this is connected to desktop audio which means all outputs from desktop audio right

click add and then audio capture
depending on the options audio input or
output capture audio input capture is
more like a microphone audio output
capture is more like a local source so
let's balance the audio between the
condenser and the desk top the general
principle is to going to be first to
have them balanced but second to have
them near their full dynamic
range rightclick Advanced Audio
properties and I'm just going to resize
this and move this window
slightly if it's quieter than peaking
that could be fine but it might be too
quiet and you might miss out dynamic
range and if it's too loud then it's
going to be too loud so first I'm going
to set the condenser microphone phone
and I'm changing the percentage volume
just speaking in a normal way until it's
peaking red 4 149% in this setting and
then just pulling back a little bit 383
per. now desktop audio but it still
peaked a little bit because I moved
position so I'm just going to pull it
back
more uh this composite no this gold
observation node with a goal
prior so what this says is um do
GV based optimization around this note
this just because it was playing out
loud at my computer it also spiked the
condenser which it wouldn't do if you
were wearing headphones which is a good
reason to wear headphones but here the
desktop audio was peaking and I moved it
up to 125% to be balanced so now we're

this could be a video that you're capturing and doing a reaction video with or this could be a video chat and audio playing through your video chat so if you're in the video chat room talking and needing to record you need both the condenser microphone audio and the desktop audio which is what you hear through your headphones if you're using another computer to live stream from or you're just live streaming the meeting and you don't need to speak through a microphone you would only need desktop audio so we're good on audio now let's go

into cropping and window sharing so here

Source add

window capture or screen capture here

it'll be a window

capture they move

around you can resize contrl Z

undoes and you can do most of the

operations that you expect like contrl C

and control V for copy and

paste one common thing to mention here

is right click

and properties is where you can crop so

here's a cropping view let's just say I

wanted to show this video but I wanted

to remove the top bar of the browser or

the YouTube sign then crop top just

using the scroll wheel or arrow keys or

typing in a

number you can crop it to

only the section that you

want so let's say just this

section do modif the

object I'm deleting the one that I

copied and now we can stretch it out
more you could also do different kinds
of Transformations and filters and
things like that rotating and so on so
again to the big equation Audio Plus
visual we're capturing both the
microphone locally and the audio coming
through the headphones both sides of the
conversation we're featuring the main
content that we want to feature whether
it's a video that you're playing locally
or a YouTube video or a video conference
and then there's an image here and then
there's the text so properties
rightclick properties of the image you
could just change which image it's
pointing to you can also do in sources
rightclick add image you can play all
kinds of different things through those
sources and then modifying plain text
rightclick properties just typing out
the

text right click

adding and then different texts find out
what works best on your computer and
your setting but that is all the
information needed to recapitulate
basically how this was live streamed
just a few days ago in terms of the
image text audio visuals and the capture
here was of

Zoom a few other notes recording or
streaming in studio mode so here we are
back in OBS clicking Studio mode splits
out into two

screens the one on the right is called
program and this is the one that's going
live whether to a recording or and or a

live stream on the left is preview so this is kind of like the adjacent possible or the offstage so then we could say well we know we're going to go to a break and I want the break to look like this so on the right the program is still showing the people talking and the audio is still being Lo but then I know that we're going to switch to text and image only and then when you hit transition that goes live and then you can say okay when we come back from break I want it to look like this and then transition and you can modify the way that transition looks and how it fades out so Studio mode is pretty simple and it's a good way to set up a scene you can also switch to a different scene behind the scenes so here switching from this one now we're in a different scene and last let's look through the general settings here is some of the theme information for how it looks and what language it's in stream this is if you want to do live streaming where you can manually copy and paste in your stream key which anyone who has that can stream to your Channel or you can do different kinds of logins so there's different ways to stream the output is the bit rate of the video and the audio different encoder settings audio is which audio sources are which and what the audio mixer shows in terms of this

spiking meter videos where you set the resolution and frame rate hotkeys there's a lot of options for advanced OBS use to do different things with key combinations accessibility has different color options and advanced has some further options including stream delay and automatically reconnect which are good to have enabled and those are pretty much all the settings of OBS there's also a lot of plugins and a lot of ways to level up and use OBS in really interesting ways so that's all there is to say about composing the audio and the visual so that you can hit start

recording last section of the video live streaming is incremental transmitted remote recording briefly I will review the roles-based approach to live streams that we have found effective as a draft contribution into this space so just review some slides that we have built up over the years at the Active inference

Institute some tips on live streams they are totally just presented as what we have done other contexts are going to be different some of these are just general comments though on live streamings that you might find useful respecting the context and audience being clear and consensual about how words and images are being captured and recorded and used joining on time or understanding when and how people are going to be joining if it's a live recording for

people in any role on the live stream
having a comfortable setup for them and
in terms of buying a webcam or
microphone if you can there are
sometimes good microphones available new
or renewed that are quite good and will
get you very far almost up into the
professional level of recording the
microphone that I'm speaking with now a
condenser microphone that was probably
30 to 40 Us in
2020 webcam of course similar there's a
lot of different ways to make your
visual appearance how you want to be
seen from having a higher resolution
webcam or lighting or different
things there's different video options
in terms of your computer for reasons of
digital and cognitive bandwidth it's
good to close any and all extra program
so there's no messaging alerts or
distractions things popping up on the
screen these are for people who are
going to be talking or even just
participating in the live stream and
using appropriate language and
behavior different things that people
may want to ask before a live stream and
different protocols that participants
might want to be familiar with in terms
of how they can participate for people
who are going to share their screen it's
really important to cover up all the
extra information close all other
windows or use a separate computer so
that there's no possibility of sharing
the wrong window and make sure that you
figured that out before the live stream

if possible the broadcaster the person who's using OBS has some different checks that they could make in terms of all the scenes and the settings the the audio included and balanced visuals the stream key and the video resolutions which can't be changed live the internet bit rate the video bit rate which can be adjusted during the stream this computer especially it's important to close even messaging applications they can disrupt some Network continuity and to be ready facilitator a little bit outside the scope of this video but whatever facilitation Style is relevant and live streams are organized events so ensuring that the organizer is also part of all these conversations and the planning and all of that so I hope in this video with the fundamental equation of recording or live streaming video equals Audio Plus visual visual what you see is what you get audio capture and balance the correct audio you have the broader framework to head into this very general tool OBS compose the audio and the visuals that you expect and prefer test you can do a private live stream you can also do recordings it's good to do recording and make sure that the audio and the visuals are how you expect them to be and then you can go live and go from there and last piece I hope that was useful looking forward to people's contributions and improvements

to the space bye
